

Evolution of the Iconic Face of our Planet

Earth Today

Pictures of Earth from space are forced to show just one side at a time. However, if there are no reason to show a particular side, it will be more interesting to show the side with the most land area cover, a fair proof that this is Earth, ignoring the fact that our planet surface is mostly covered by water and the name Ocean fits much better. Today this iconic face is just over Asia, but more interesting is to see how it changed over time million of years ago (Mya).
